CELEBRATING 80 YEARS

Company Capability Statement

Power Engineering proudly celebrates 80 years of continuous operation, reflecting long-term stability, technical excellence, and a sustained commitment to customer satisfaction. With a dedicated team of 22 employees, we provide responsive, relationship-driven service supported by strong internal systems and accountability.

Our customer service program is built around proactive communication, rapid response, and measurable performance. Because we are headquartered in Salt Lake City, we are able to provide expedited chemical production and delivery, minimize lead times and ensuring continuity of operations. We also have a salesman and storage based in Idaho Falls, Idaho. Our localized presence allows us to respond quickly to service needs, operational questions, and emergency situations.

We also prioritize education and transparency. Power Engineering offers comprehensive on-site training, including our structured “Water Treatment 101” program designed for operations personnel, maintenance staff, and facility managers. This ensures that everyone understands system performance, chemical application, and best practices for protecting assets and maximizing efficiency.

Power Engineering designs, manufactures, and supports complete water treatment solutions. We operate a fully equipped fabrication shop where we manufacture our own feed equipment and custom systems, allowing us to maintain strict quality control standards while tailoring solutions to site-specific requirements. We also stock many pumps, parts, controllers, and other various equipment.

In addition, we manufacture our own chemical formulations, giving us direct oversight of product consistency, performance, and supply chain reliability. Our in-house PhD chemist leads laboratory operations, including quality control (QC), research and development (R&D), and advanced analytical testing. This capability allows us to deliver data-driven treatment programs and continuously refine formulations to meet evolving system demands and regulatory standards.

Power Engineering also offers hands-free chemical delivery and transfer directly into onsite chemical storage tanks. This proposal includes bi-monthly water treatment testing and service visits to ensure the systems are operating efficiently and within specified control limits.

In addition, our program includes remote monitoring capabilities integrated with the water treatment controller. The system provides real-time alarms and notifications when operating parameters fall outside established limits, allowing our team to respond quickly and proactively to potential issues before they become significant problems.

Power Engineering utilizes a digital service reporting system that provides immediate access to completed service reports. Once our technician completes and submits a report onsite, it is instantly available for your review. This ensures complete transparency, verifies that scheduled service was performed, documents all testing and corrective actions, and provides accountability for our team. The online reporting system allows you to access service history, test results, recommendations, and system performance data whenever needed.

To further support our customers, Power Engineering maintains a local Idaho representative and chemical storage inventory. This local presence helps ensure timely chemical deliveries, rapid response to service needs, and minimizes the risk of operational disruptions due to chemical shortages or emergency situations.

Power Engineering also maintains both State & GSA Contracts, allowing customers the option to review our approved products and services and purchase through the State & GSA procurement process if desired.

We are active members of two leading industry associations, which provide ongoing access to the latest advancements in equipment design, chemical innovation, and updated best practices aligned with current industry standards. This involvement ensures our solutions remain current, efficient, and technically sound.

With eighty years of experience, in-house manufacturing capabilities, advanced laboratory support, and a strong customer-focused culture, Power Engineering is well-positioned to deliver reliable, high-quality water treatment solutions tailored to each customer's operational needs.
